Aim. This study was aimed to investigate whether the practice of laughter yoga in nursing students who just started university can help them cope with stress. *Design*. An experimental randomized controlled study was conducted. *Methods*. The research was conducted with first-year students ($n = 38$) who were willing to participate in the study. The intervention group took part in six 45–50 minute laughter yoga sessions twice a week for three weeks. *Results*. The comparison of the mean and total scores obtained from the Coping Behavior Inventory and Physio-Psycho-Social Response Scale by the participants in the control and intervention groups before and after the implementation of the laughter yoga practices demonstrated that there was a statistically significant difference between the two tests in the intervention group and the difference was especially evident between the pre- and posttest scores obtained from the Coping Behavior Inventory. *Conclusions*. In this study, laughter yoga practice helped the participating nursing students who just started university to cope with stress. It can be recommended that laughter yoga should be integrated into the curriculum in schools where nursing education is provided as a way of coping with stress, that its use should be expanded, and that randomized controlled experimental studies in which its physiological and psychological effects in different groups are investigated with objective and subjective parameters should be conducted.

1. Introduction

College years are a period during which transition from adolescence to young adulthood takes place. During this period, individuals not only try to bear the responsibility of being a young adult but also experience difficulties of university life. First-year students who have just started university may experience confusion in a new, different, and unfamiliar environment and in the face of uncertain situations and may need psychological help. Among general problems experienced by students in Turkey are economic (scholarships, transportation, and pocket money), academic (future, lecturers, and courses), adaptation (cultural differences, environment, and city), social (university opportunities, friendship, and leisure), and other (accommodation, security, and nutrition) issues [1–3]. It has been reported that students, especially those coming from different provinces for university education, have difficulties in adapting to the city in terms of transportation, climate, and city facilities. In addition, during the university preparation phase, young people who postpone their problems and leave the solution until after they settle into the university due to their success-centered family attitudes, try to cope with these problems in the university environment [2].

Nursing education is a planned education program with theoretical and clinical background. Students attending this program, such as other students, experience all the difficulties of university life. They are faced with problems specific to nursing education such as difficulties in adapting to professional courses, the stress of performing clinical practice for the first time, the fear of making errors in clinical practices, the thought that the practice areas are intense and stressful, anxiety related to the possibility to be exposed to occupational risks, and anxiety caused by witnessing death and dying patients during clinical practices and thus they try

Perspectives in Psychiatric Care

About this Journal

Aims and scope

Perspectives in Psychiatric Care (*PPC*) is recognized and respected as the leading journal for advanced practice psychiatric nurses. The journal provides advanced practice nurses with current research, clinical application, and knowledge about psychiatric nursing, prescriptive treatment, and education. It publishes peer-reviewed papers that reflect clinical practice issues, psychobiological information, and integrative perspectives that are evidence-based. *Perspectives in Psychiatric Care* considers original research and review articles on mental illness and pharmacology, the art of prescribing, integrative perspectives, and private practice issues.

Abstract

Aim. This study was aimed to investigate whether the practice of laughter yoga in nursing students who just started university can help them cope with stress. Design. An experimental randomized controlled study was conducted. Methods. The research was conducted with first-year students (n = 38) who were willing to participate in the study. The intervention group took part in six 45-50 minute laughter yoga sessions twice a week for three weeks. Results. The comparison of the mean and total scores obtained from the Coping Behavior Inventory and Physio-Psycho-Social Response Scale by the participants in the control and intervention groups before and after the implementation of the laughter yoga practices demonstrated that there was a statistically significant difference between the two tests in the intervention group and the difference was especially evident between the pre- and posttest scores obtained from the Coping Behavior Inventory. Conclusions. In this study, laughter yoga practice helped the participating nursing students who just started university to cope with stress. It can be recommended that laughter yoga should be integrated into the curriculum in schools where nursing education is provided as a way of coping with stress, that its use should be expanded, and that randomized controlled experimental studies in which its physiological and psychological effects in different groups are investigated with objective and subjective parameters should be conducted.

Journal Impact Factor

The Journal Impact Factor (JIF) is a journal-level metric calculated from data indexed in the Web of Science Core Collection. It should be used with careful attention to the many factors that influence citation rates, such as the volume of publication and citations characteristics of the subject area and type of journal. The Journal Impact Factor can complement expert opinion and informed peer review. In the case of academic evaluation for tenure, it is inappropriate to use a journal-level metric as a proxy measure for individual researchers, institutions, or articles. Learn more
